KEYWORDS: PREOPERATIVE; LARYNX CANCER; QUALITY OF LIFE.

INTRODUCTION

Head and neck cancer is one of the six most prevalent neoplasms worldwide, with an estimated 900,000 new cases diagnosed annually. In Brazil, there is estimated 6,390 new cases of laryngeal cancer in men and 1,280 in women for the biennium 2018-2019. These oncological patients present deterioration of their basic functions and can report a negative impact on the quality of life.

This is a pilot study that aimed to analyze and describe the quality of life and the functional changes in the preoperative larynx cancer.

METHODOLOGY AND PRELIMINARY RESULTS

This is a cross-sectional observational pilot study to evaluate functional alterations in patients preoperative of laryngeal neoplasms; at the National Cancer Institute at HCl between March/2018 to June/2018. Patients are predominantly male; aver the age of 60; with a history of cigarette smoking and alcoholism; presenting as the main complaint hoarseness for about 8.5 months. Most of the patients came to the service with advanced staging (T3 and T4) and underwent total laryngectomy (table 1).

On the evaluation of the quality of life with the University of Washington Quality of Life Assessment protocol (UW-Qol), it was observed that despite advanced staging, the hoarseness and dysphagia reported, the patients have a good quality-of-life (Table 2).

The previous protocol also showed the subdomain of speech as the main alteration in quality-of-life, consistent with the Vocal Disadvantage Index (IDV). Despite the total score within the normal range, it presents a value close to the standard value (Table 5).

By the MD Anderson Dysphagia Inventory (MDADI) most patients arrive with no reports of dysphagia, which is consistent with the clinical assessment, made though the ASHA National Outcomes Measurement System Scale, in that on no alteration was perceived for oral intake, or in some cases, patients simply had to avoid certain types of food or need more time to eat (Table 3 and Table 4).

Table 1 - Sociodemographic and Clinical Aspects

Patient	Gender	Age	Civil Status	Education	Smoker	Alcoholic	Complaints / Symptoms	Time in Months of Symptmos	TNM	Treatment
1	M	73	Single	1st grade incomplete	+	+	Hoarseness	5	T3NOMO	Total Laryngectomy
2	M	71	Widower	2nd grade complete	+	+	Hoarseness	9	T2NOMO	Total Laryngectomy
3	M	46	Single	1st grade complete	+	+	Hoarseness and dysphagia	6	TxNOMO	Total Laryngectomy
4	M	62	Separated	Graduated	+	+	Hoarseness	11	No information	Total Laryngectomy
5	M	62	Single	2nd grade complete	+	+	Hoarseness, dysphagia, dysphonia and dyspnea	24	T4NxMx	Total Laryngectomy
6	M	68	Single	Graduated	+	-	Dysphonia	No information	T3NOMO	Supratracheal Laryngectomy
7	M	54	Single	2nd grade complete	+	+	Dysphagia and sore throat	4	T4N2bM0	RxT + QT
8	F	55	Married	1st grade incomplete	+	-	Hoarseness and sore throat	3	T4aN1M0	Total Laryngectomy
10	M	57	Married	2nd grade complete	+	-	Hoarseness and shortness of breath	7	No information	Total Laryngectomy
9	F	59	Single	1st grade complete	+	+	Dysphagia and odynia	8	T4aN1M0	Rxt + QT

Average	44,25	38,75	47,75	43,57

CONCLUSION

From the preliminary results, it was possible to verify that despite the complaints report, the patients' quality-of-life is not as affected as expected. Continuous study is needed to obtain more accurate results in patients with larynx cancer.
